## HOW TO REPLY TO THIS NOTICE:

I. Review the SMALL ENTITY status shown above.

If the SMALL ENTITY is shown as YES, verify your current SMALL ENTITY status:

A. If the status is the same, pay the TOTAL FEE(S) DUE shown above.

B. If the status above is to be removed, check box 5b on Part B - Fee(s) Transmittal and pay the PUBLICATION FEE (if required) and twice the amount of the ISSUE FEE shown above, or

If the SMALL ENTITY is shown as NO:

A. Pay TOTAL FEE(S) DUE shown above, or

**DETAILED ACTION**

1. This application is responsive to application number (10/539684) filed on January 12, 2006. Claims 1, 12, 17, 26, and 80 are pending and have been examined.

***Allowable Subject Matter***

2. Claims 1, 12, 17, 26, and 80 allowed.
3. The following is an examiner's statement of reasons for allowance: The closest prior art read: Le Pennec et al (US 6,836,569, hereafter Le Pennec) in view of Washizawa (US 5,917,943).

As per **claim 1**, Le Pennec discloses a method of processing n-dimensional digital signals, n being an integer at least equal to 1, comprising the steps of:

(a) receiving an n-dimensional digital input signal (Fig 1 element 101; column 7 lines 18 – 22; Le Pennec is describing an n-dimensional digital input signal and further is Le Pennec describes being received by a system);

(b) computing an n-dimensional warped signal from said n-dimensional digital input signal, the n-dimensional warped signal including n-dimensional warped coefficients and n-dimensional signal warping grids (Fig 1 element 110; column 7 lines 18 – 24 and 60 - 65; the examiner knowledge of warping deals with geometric transformation which Le Pennec describes in the prior art); and

(c) computing warped wavelet packet coefficients and wavelet packet warping grids by applying an n-dimensional warped wavelet packet transform to said warped signal (column 7 lines 28 – 38).

However, Le Pennec does not explicitly teach with a binary tree where each node performs a one-dimensional warped subband processing along a respective dimension  $d$ , with  $1 < d < n$ .

In the same field of endeavor, Washizawa teaches with a binary tree where each node performs a one-dimensional warped subband processing along a respective dimension  $d$ , with  $1 < d < n$  (column 7 lines 9 -21; Washizawa teaches using a binary tree on images and is well-known and the art. It would have been obvious to use this method on wavelet coefficients).

Therefore, it would have been obvious for one having skill in the art at the time of the invention to modify the invention of Le Pennec with the invention of Washizawa. Binary trees are well-known to the invention of wavelet subband coding to provide an optimal level of image compression efficiency.

4. The examiner after searching couldn't find the newly amended claims 1 and 26 dated February 03, 2011:

As per claim 1, A method of processing n-dimensional digital signals,  $n$  being an integer at least equal to 1, comprising the steps of:

(a) receiving an n-dimensional digital input signal;

(b) computing an n-dimensional warped signal from said n-dimensional digital input signal, the n-dimensional warped signal including n-dimensional warped coefficients and n-dimensional signal warping grids; and

(c) computing warped wavelet packet coefficients and wavelet packet warping grids by applying an n-dimensional warped wavelet packet transform to said warped signal, with a binary tree where each node performs a one-dimensional warped subband processing along a respective dimension  $d$ , with  $1 < d < n$ ;

wherein said signal warping grids are computed from a warping geometry defined by region parameters specifying a partition of a signal support into a plurality of regions and deformation parameters specifying geometrical deformation functions respectively associated with said regions, whereby the geometrical deformation function associated with one of the regions provides positions of sampling points within said one of the regions;

wherein  $n=3$ , said n-dimensional digital input signal represents a video image sequence, and wherein the step of computing the n-dimensional warped signal comprises estimating motion vectors within said video image sequence, determining at least one of said n-dimensional geometrical deformation functions by applying a time displacement to a 2-dimensional geometrical deformation using said estimated motion vectors, and computing said n-dimensional warped signal from said warping geometry and said n-dimensional digital input signal.

As per claim 26, a method of processing n-dimensional digital signals,  $n$  being an integer at least equal to 1, comprising the steps of:

receiving an n-dimensional digital input signal;

computing an n-dimensional warped signal from said n-dimensional digital input signal, the n-dimensional warped signal including n-dimensional warped coefficients and n-dimensional signal warping grids;  
computing warped wavelet packet coefficients and wavelet packet warping grids by applying an n-dimensional warped wavelet packet transform to said warped signal, with a binary tree where each node performs a one-dimensional warped subband processing along a respective dimension d, with  $1 < d < n$ ;

applying a bandeletisation to said warped wavelet packet coefficients and wavelet packet warping grids, wherein said bandeletisation comprises computing bandelet coefficients by applying invertible one-dimensional decorrelation operators to said warped wavelet packet coefficients along selected directions of said wavelet packet warping grids;

quantizing said bandelet coefficients to produce quantized bandelet coefficients;  
and encoding said quantized bandelet coefficients and said region and deformation parameters into a multiplexed data stream suitable for storage in a storage medium or for transmission over a transmission medium, said multiplexed data stream being a compressed representation of said n-dimensional digital input signal from which the n-dimensional warped signal is computed;

wherein said signal warping grids are computed from a warping geometry defined by region parameters specifying a partition of a signal support into a plurality of regions and deformation parameters specifying geometrical deformation functions

respectively associated with said regions, whereby the geometrical deformation function associated with one of the regions provides positions of sampling points within said one of the regions;

wherein  $n=3$  and said  $n$ -dimensional digital input signal represents a video image sequence, and wherein the step of computing the parameters defining the warping geometry comprises

estimating motion vectors within said video image sequence and determining at least one of said  $n$ -dimensional geometrical deformation functions by applying a time displacement to a 2-dimensional geometrical deformation using said estimated motion vectors.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
